

>> noscito user

noscito user monitors Websites and Web based applications. It tests the performance and availability of static, dynamic and personalised dynamic Web pages securely over the internet.

noscito user is managed by a central noscito Portal and a number of Global Remote Service Monitors situated around the world. These Global Monitors simulate a user stepping through your application. If the page display, path or page times fall outside of the customised acceptable performance thresholds it sends a message to the central Portal.

The central Portal then sends an alert to the designated contacts via Email and/or SMS messages to let you know that the site performance or availability is compromised.

noscito user also enables you to view online reports on the robustness and reliability of your Website and Web based applications, in real time.

As noscito user provides continuous monitoring, it offers visibility of time-to-resolution if something should go wrong.

Global Remote Service Monitors are located in major cities including London, Amsterdam, Chicago, Vancouver, Sydney and Seoul. These monitors ensure that you have an accurate picture of performance and reliability of web transactions at a local level.

Should you want to monitor applications from your remote offices around the world noscito user enables you to download and use your own remote service monitors.
